SAFETY CHECK-OUT (US Model)

After correcting the original service problem, perform the following safety check before releasing the set to the customer:

Check the antenna terminals, metal trim, "metallized" knobs, screws, and all other exposed metal parts for AC leakage. Check leakage as described below.

LEAKAGE TEST

The AC leakage from any exposed metal part to earth ground and from all exposed metal parts to any exposed metal part having a return to chassis, must not exceed 0.5 mA (500 microamperes). Leakage current can be measured by any one of three methods.

1. A commercial leakage tester, such as the Simpson 229 or RCA WT-540A. Follow the manufacturers' instructions to use these instruments.
2. A battery-operated AC milliammeter. The Data Precision 245 digital multimeter is suitable for this job.
3. Measuring the voltage drop across a resistor by means of a VOM or battery-operated AC voltmeter. The "limit" indication is 0.75 V, so analog meters must have an accurate low-voltage scale. The Simpson 250 and Sanwa SH-63Trd are examples of a passive VOM that is suitable. Nearly all battery operated digital multimeters that have a 2 V AC range are suitable. (See Fig. A)

SECTION 8

TROUBLESHOOTING

The following troubleshooting will help you correct the most common problems encountered with a tape deck. Should any problem persists after you have made these checks, consult your nearest Sony service facility.

Before proceeding with these trouble checks, first check these basic points:

- The power cord must be firmly connected.
- Amplifier connections must be firmly made.
- Heads, capstans and pinch rollers should be clean.
- The amplifier controls and switches should be set correctly.

	Trouble	Cause and remedy
TAPE OPERATION BUTTONS AND TAPE TRANSPORT	The tape does not run when the operation button is pressed.	The unit does not work for about two seconds after the power is turned on. → Wait until the II indicator goes off.
		The cassette is not properly inserted.
		The cassette holder is not properly closed.
		The II button is pressed. → Press the II button again to release the pause mode.
	The transport noise seems excessively loud at the fast winding mode.	No trouble. This situation depends upon the cassette used.
	The automatic shut-off mechanism activates before the tape ends.	The cassette has tape slack. The cassette is defective.
RECORDING AND PLAYBACK	The ● button does not activate.	No cassette is in the holder. The cassette tab has removed. → Cover the hole with plastic tape.
	The AMS function does not operate.	A blank space is too short (less than 4 seconds). → Insert over 4-second blank with the record muting button.
		There is noise in the blank space between selections.
	Playback cannot be heard, recording cannot be made, or the sound level decreases.	The heads are dirty. The connections are not made properly. The amplifier input selector is not set to the correct position.
	Excessive wow and flutter or drop out	The heads, capstans or pinch rollers are dirty.
	Incomplete erasure	The erase head is dirty.
NOISE	Noise or erasure occurs.	Magnetic build-up on the head. → Demagnetize the head.
	Unbalanced tone in higher frequencies.	The DOLBY NR switch is not set to the correct position. → During playback, set the switch to the same position used when the cassette was recorded.
		The unit is placed near a television set.
	A hum is heard.	The unit is placed directly on or under the amplifier. → Move the unit away from the amplifier.
	Noise is recorded.	Recording is made near a television set or a color monitor. → Move the unit away from the television set or color monitor.
